

SETTING NEW STANDARDS IN DRIVING SAFETY & USER EXPERIENCE

camera-based in-cabin monitoring software

Dr. Michael Hödlmoser, CTO

Our **Human AI model** analysis camera images and provides unlimited data points on human bodies enabling a new level of **human-machine interaction** as well as **supporting** and **protecting humans** in **every situation**.

Creating Human AI models required special data in large quantities. Our proprietary **Virtual Human Simulator** is our unique **in-house** tool for simulation of virtual humans and **synthetic human body data generation**. It enables us to **purely virtually develop** camera-based Human AI models in a never-before-seen comprehensiveness and robustness, fully GDPR-compliant, while requiring minimal resources & time for data creation.

Simulation-driven
synthetic data
generation

Human character
simulation

Virtual sensor
simulation
(2D & 3D, NIR/RGB/ToF)

Environment simulation
(Lighting, camera
position, etc.)

VIRTUAL HUMAN SIMULATOR

UNLIMITED DATA – FAST AND GDPR COMPLIANT

- Single source for synthetic data
- Unlimited data points – quickly and efficiently, no data bias
- GDPR compliant, no privacy complications

Generate data for AI
model training

HUMAN AI MODEL

→ **Highest flexibility, cost-efficient
Human AI development**

→ **Enabling previously impossible
Human AI models**

Our CABIN EYE software stack analyses **human characteristics & action** in real-time inside vehicles via cameras. This enables **innovative safety, user experience and automation capabilities** inside vehicles and addresses nowadays as well as future occupants' needs.

CABIN EYE

POWERFUL & VERSATILE IN-CABIN HUMAN ANALYTICS PLATFORM

FOR SHARED MOBILITY

Trustworthiness in Machine Learning Models

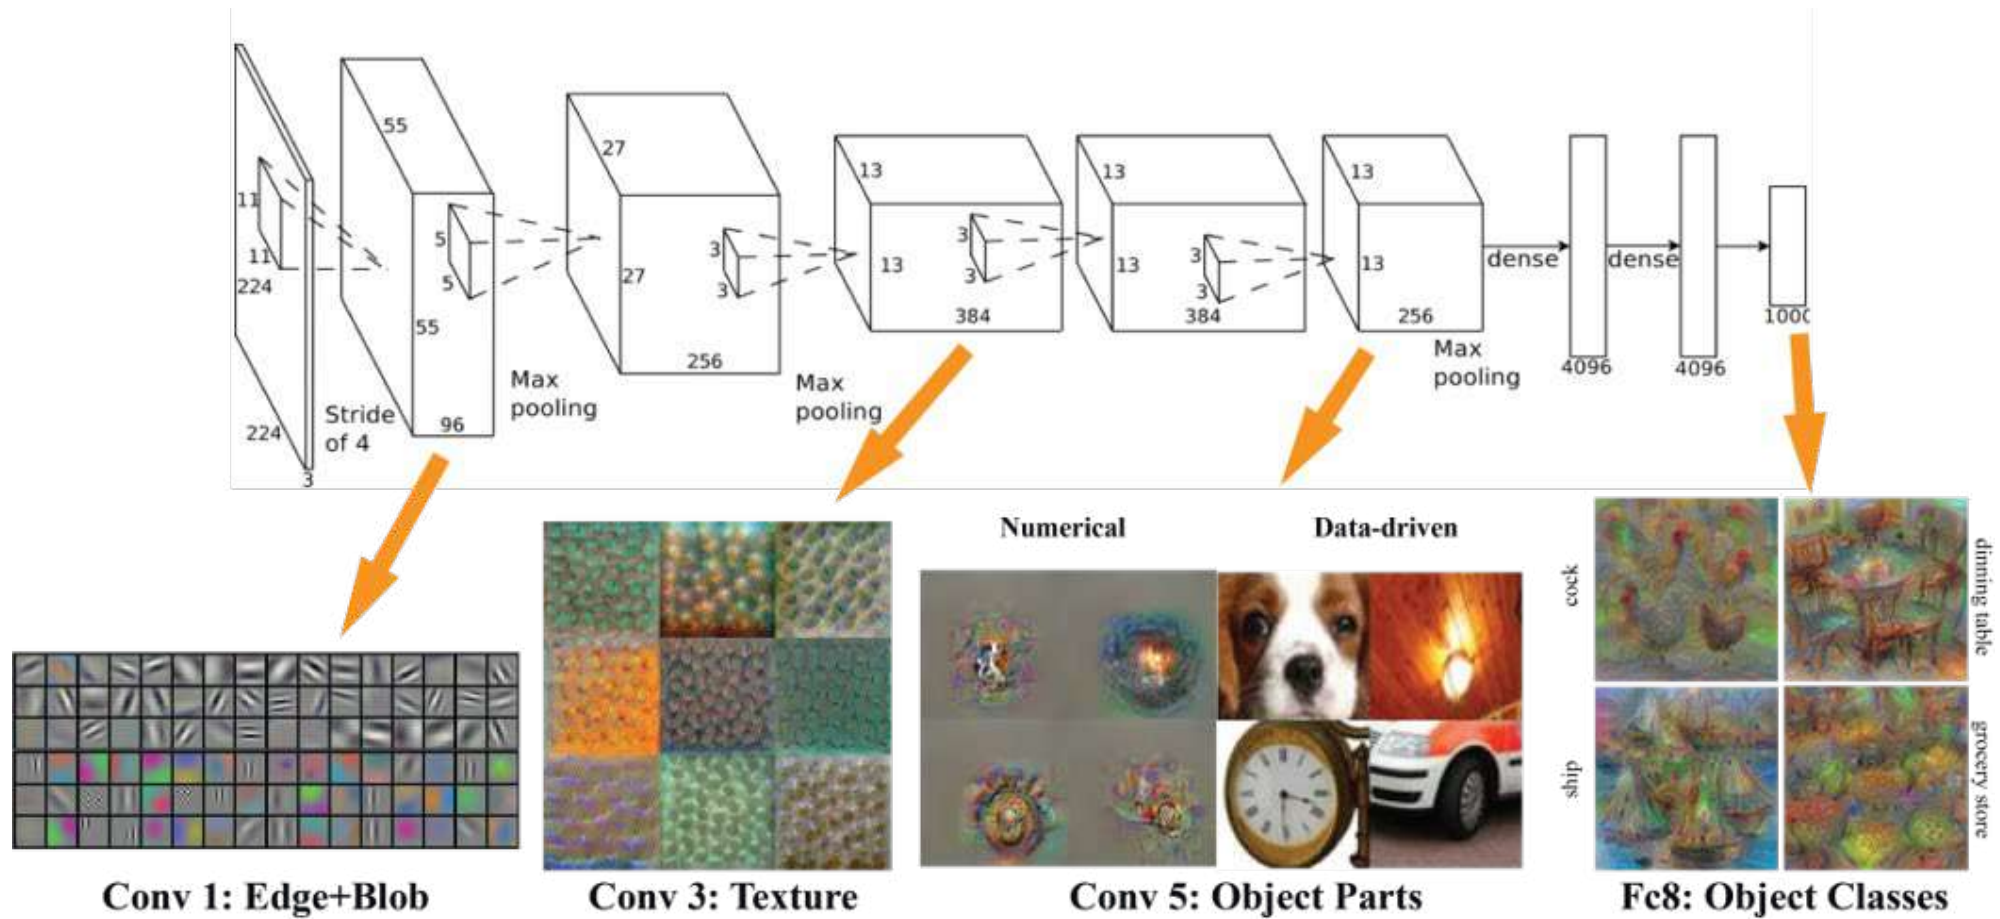

- **How to achieve trustworthiness?***

*Parts of the work were funded by aws, project Safe.ICM

A wireframe illustration of a car interior, showing the driver's seat, passenger seat, and a child seat in the back. The driver and passenger are highlighted with a green wireframe skeleton and a rectangular box around their faces, indicating motion tracking or facial analysis. The background is a dark teal color with a subtle grid pattern.

Technical solutions

Before optimization

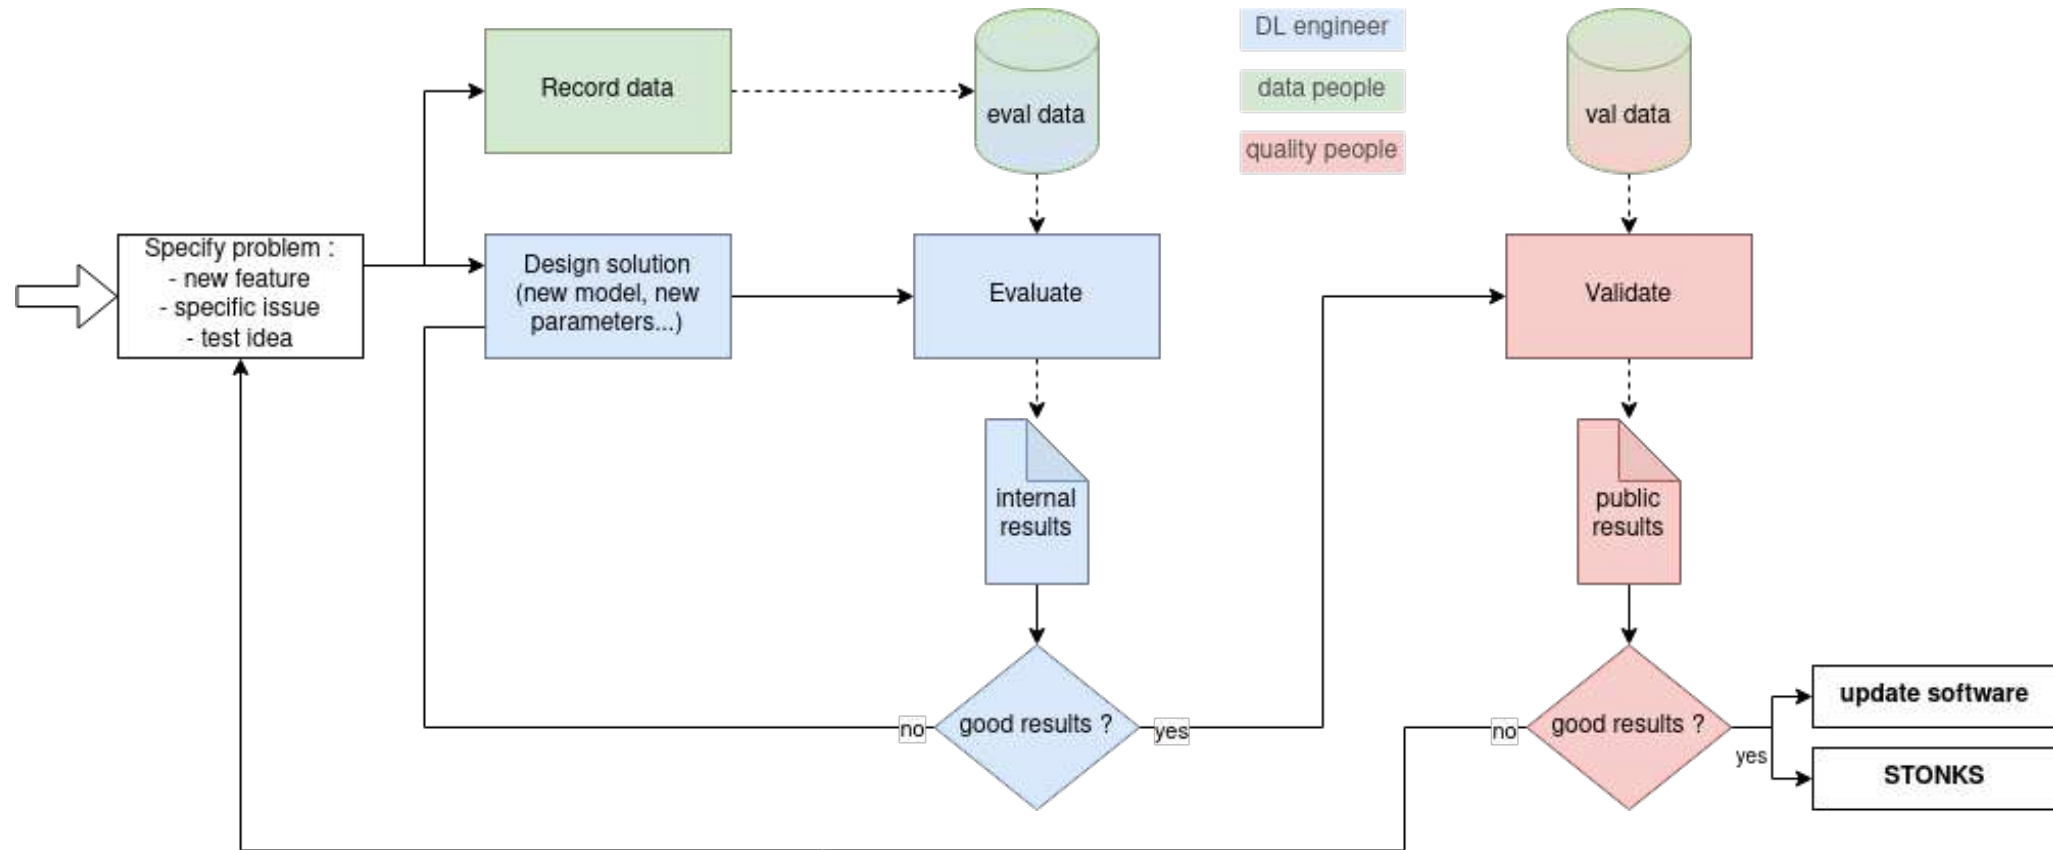

After optimization

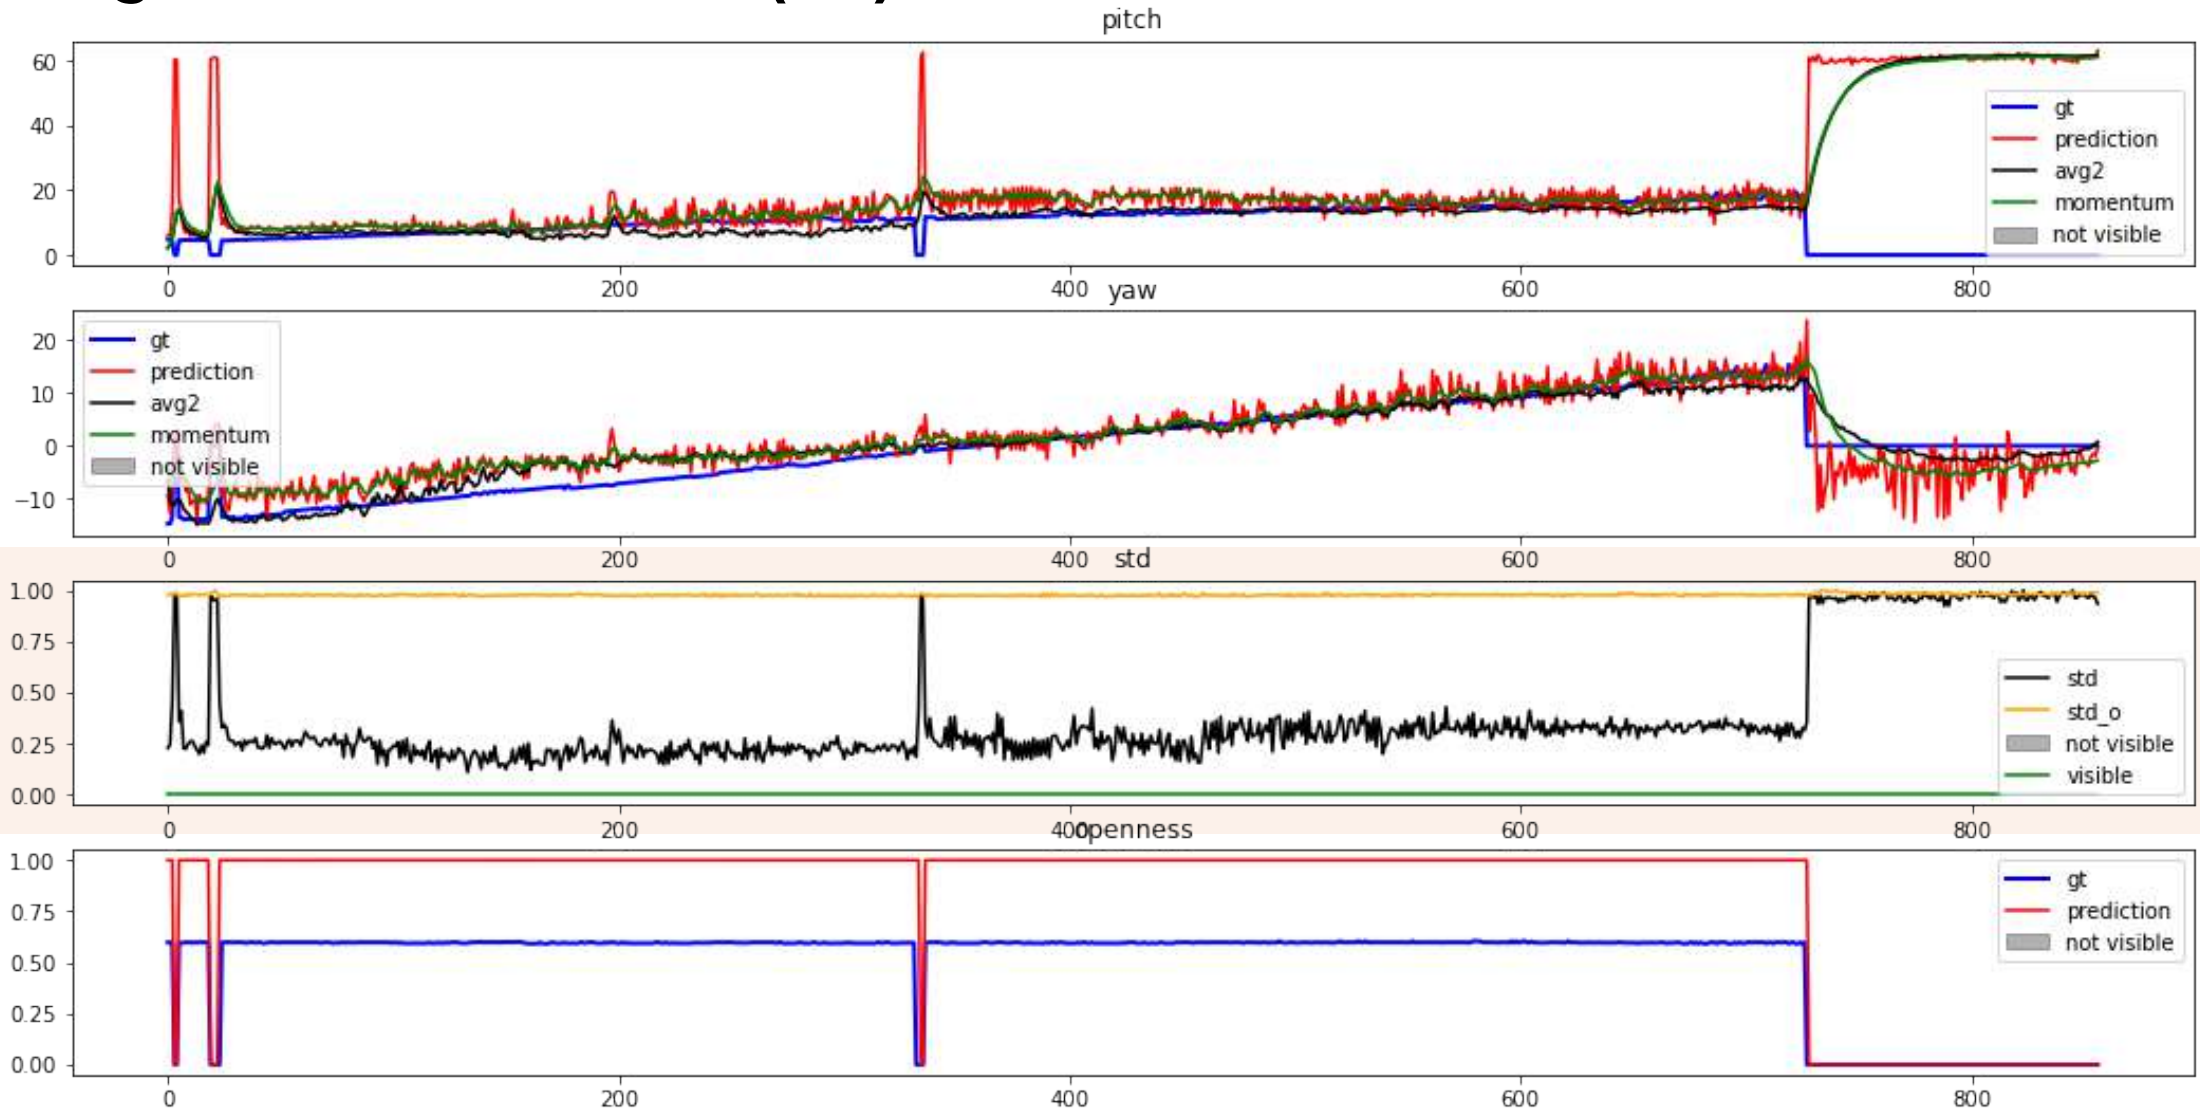

- Improve the outcome of one task by solving multiple tasks at the same time

left_err : 4.0 | avg_err : 2.7

- Modeling based on confidence (std)

Initial

Optimized

Optimized results for e.g. occlusions →
Integration of occlusion level

Optimized eye openness

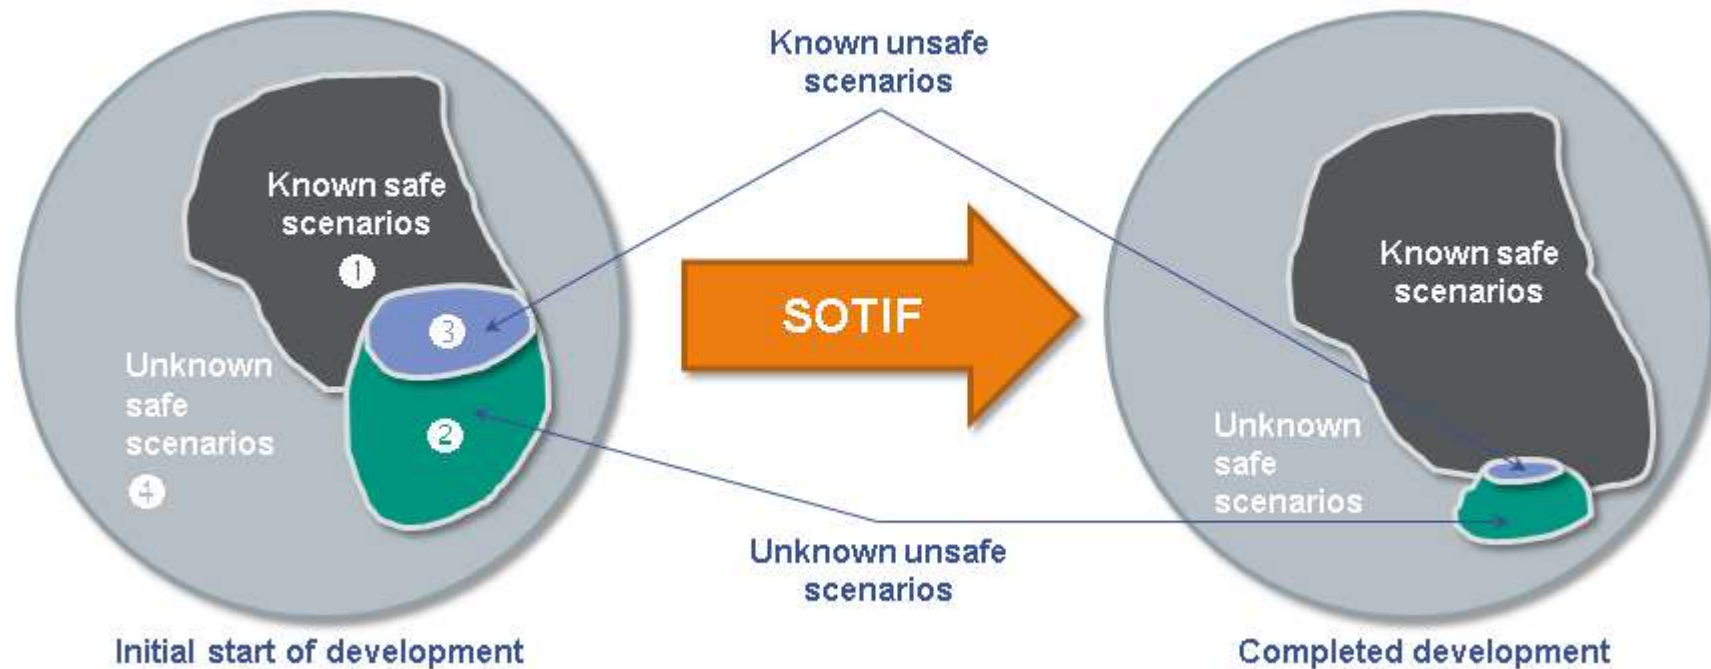

Optimized results for extreme head poses

A stylized illustration of a car interior, rendered in a teal color palette. The image shows the driver's seat, the passenger seat, and a child seat in the back. Overlaid on the driver and passenger are skeletal motion-tracking diagrams, consisting of lines connecting dots at the joints of the head, neck, shoulders, elbows, and wrists. Rectangular boxes are drawn around the faces of the driver and passenger, indicating facial motion tracking. The overall aesthetic is technical and futuristic.

Data

- **Unknown unsafe scenarios (2) can be reduced by means of suitable tests**
- **Known unsafe scenarios (3) are eliminated by design measures (e.g. shutting down the system, etc.)**

Driver out of FoV

Overloaded car

Rear passengers at same distance as front passengers

Weird costumes

Feet on dashboard

Looking on phone

Animals not in carriers

- **Get as varied as possible**
- **Save all possible parameters :**
 - Ethnicity
 - Age
 - Gender
 - Camera
 - Weight
 - Height
 - Head orientation
 - Keypoints
 - Exposure time
 - ...

THE FUTURE OF AUTOMOTIVE SAFETY & DRIVING EXPERIENCE
